

Control system of black microgrid

What is a microgrid?

Microgrids (MGs) represent one outcome of this transformation. The MG represent a compact power system comprising of independent renewable energy resources (RERs), energy storage systems (ESSs), and loads operating as a unified control system to generate power for localized areas within the range of 10-100 MW [3,4].

Why do we need a control system for microgrids?

High penetration of Renewable Energy Resources (RESs) introduces numerous challenges into the Microgrids (MG), such as supply-demand imbalance, non-linear loads, voltage instability, etc. Hence, to address these issues, an effective control system is essential.

What are microgrid control objectives?

Microgrid (MG) system control objectives. It refers to MG ability to uphold a consistent voltage level across all the buses during standard operating conditions and when confronted with diverse disturbances. Events like load shedding, short circuits, islanding operations in MG causes voltage to fluctuate from the scheduled value
