What are perovskite solar cells?

Researchers worldwide have been interested in perovskite solar cells (PSCs) due to their exceptional photovoltaic (PV) performance. The PSCs are the next generation of the PV market as they can produce power with performance that is on par with the best silicon solar cells while costing less than silicon solar cells.

Are perovskite solar cells a viable alternative to c-Si solar panels?

Perovskite solar cells are the main option competing to replace c-Si solar cells as the most efficient and cheap material for solar panels in the future. Perovskites have the potential of producing thinner and lighter solar panels, operating at room temperature.

Is perovskite a good material for solar energy conversion?

Categorized by the specific crystal structure and outstanding light absorption ability, perovskite material has shown much potential to achieve high solar energy conversion efficiency. PSCs have made impressive advances in efficiency since the beginning of the 2000s and have come to the level of Silicon and thin-film solar cells.

What is the future of perovskite solar cells?

The future of perovskite solar cells (PSCs) is bright, with newer developments in material science and engineering being carried out to improve upon the efficiency of the cells, search for lead-free perovskite materials, work on the scalability of the technology and integration of flexible and multi-junction perovskite solar cells.
