Can energy storage be used at the airport?

Energy storage at the airport is an interesting alternative to supply electric aircraft charging. It can support electric aircraft charging and reduce peak charging power, thus reducing peak demand from the grid. This limits stress on the surrounding power grid and may reduce the cost of more extensive grid connections to the airport.

What charging methods are available at airports?

Different possible charging methods that could be available at airports include plug-in charging, battery swapping, and mobile charging. The two most analysed charging methods are plug-in charging and battery swapping, however, systems with mobile charging stations are studied as well.

Which energy storage technology is best for airport implementation?

Batteries are the energy storage technique with the highest potential for early airport implementation due to their high efficiency. The dual usability of hydrogen, following the introduction of hydrogen aircraft, makes it a viable option for future airport implementation.

How do airports supply electricity?

Several methods are available for airports to supply the electricity demand from aircraft charging, each with challenges and opportunities. The energy transition at airports also includes introducing electricity production from renewable energy sources and implementing energy storage systems.
