

The difference between power stations and outdoor power supplies

Is a power station a generator?

A power station is not a generator. This may be confusing if you're new to the subject of portable power, but it's not your fault. The word generator is sometimes used loosely to encompass a wide range of products that share the same goal: providing electricity without a connection to the grid.

Why should you buy a power station?

One of the biggest draws of a power station is that it's emission-free. This makes it more eco-friendly, and you can run it safely inside the home. With no engine, it also produces little to no noise, except the occasional internal fan turning on to keep it cool.

Are power stations eco-friendly?

While they are a more eco-friendly solution you can use inside the home, power stations can't create power; they run on batteries that must be recharged, which can take many hours. Power stations tend to be more expensive up front, but require less maintenance and don't run on potentially expensive fuel. A power station is not a generator.

How does a power station work?

Simply put, generators create electricity in real-time using a fuel source (gasoline, propane, or natural gas); power stations can only deliver power from internal batteries that must be recharged by plugging them into an outlet or connecting them to solar panels--they cannot create the power on their own.
